FRC Z06 Trunk Partition Installation

Installation is simple!!!

No modifications to the car are needed. The partition is friction fit and also has two Velcro straps that help hold everything in place. Installation is done from the cabin side of the car. Push the driver seat forward and line up the partition into the far corner (passenger side) of the back of your car (right behind the rear speaker). Line up the drivers side corner and push both sides into place, keeping the partition at a slight angle (bottom of the partition angled slightly towards the front of the car. Make sure you left the Velcro straps hanging into the trunk side of the car (we will get to those later). Next, the top crest of the partition should push in first and the gently press on the bottom of the partition until it is perfectly vertical.

Once it is in place, go to each corner of the partition and give one last medium push, to make sure everything is seated correctly.

Now, pop the trunk. You should see a square metal bar the runs the width of the trunk. Take the Velcro straps with the small adhesive Velcro stickies and attached the stickies onto the metal bar so that the straps can attach to the Velcro side of the stickies. The straps do NOT need to be pulled super tight, just attach them to the stickies in a way that there is not any slack in the strap.

That's it!!!

If you need to transport a large item, simply remove the partition (push it out from the trunk).

Install the partition from the front side of the car.

Next, Push one Corner into place.

Then push in opposite corner.

Lastly, do a quick push on both sides one more time just to make sure everything is snug and aligned. Push the bottom of the partition back into the car until it is vertical with the floor. Then go into the trunk and loosely attach the Velcro straps.
