

EXHAUST PLATE LEDS

TOOLS NEEDED

Regular pliers. coat hanger for fishing wire. black electrical tape. alcohol swabs.

Raise rear of vehicle and support with jackstands

Directly behind the exhaust plate you will see these 2 rear fascia mounting tabs. This is where the led plate will mount. Clean mounting area with alcohol.

Peel adhesive backing and mount led plate on flat surface facing directly at exhaust plate. Route wiring behind other fascia mounting tabs to keep away from exhaust. .

The goal is to route the wires toward the rear side marker light. I used a hanger to fish wires between rear compartment and frame rail in the corner. Bend the hanger so it will exit as shown. Tightly tape the wires to the end of the hanger and pull it through as shown. Patience may be required! This will keep the wire away from the exhaust.

Next reach up inside the rear fender and locate the rear marker light. Twist 1/4 turn to the left and drop socket down so you can connect the led wires using supplied connectors.

Connect red wire to brown wire and black to black. Make sure wires are seated correctly and close connector with pliers. Make sure led wire is left long enough to reach back up to the marker light. Put light back into housing and twist.
